HiPower 5.0

D7.3 Initial Dissemination and Communication Plan

Project acronym	HiPower 5.0
Project title	Leading edge semiconductor, integration, and control system technologies for highly compact and smart edrive components towards more sustainable power electronics 5.0
Grant Agreement No.	101194250
Call	HORIZON-JU-Chips-2024-2-RIA-T1
Project starting date	1.7.2025
Project duration	36 months
Coordinator	Christoph Abart, AVL List GmbH

Dissemination Level	PU
Deliverable type	R
Deliverable Date	2025-12-31
Deliverable Responsible	Juraj Marek, Franceso Iannuzzo

EXECUTIVE SUMMARY

This document provides an overview of the HiPower 5.0 stakeholder engagement approaches and presents a summary of the dissemination and communication activities planned and undertaken during the project lifetime to raise awareness about the project. Moreover, within this deliverable, the dissemination channels to be applied throughout the HiPower 5.0 project are described. The main activities related to dissemination and communication will center around three key audiences and stakeholders: the general public, industry, and academia.

All project partners are participating in dissemination and communication activities, taking advantage of the various communication channels available to ensure broad and targeted visibility regarding the project and its outcomes. To ensure effective dissemination and communication, the project partners select suitable tools and channels according to the targeted audience. These activities serve as a major instrument to engage interested stakeholders and the scientific community regarding the project's technical advancements and results.

Based on considerations, this document addresses the challenges of impact and visibility in the overall context of HiPower 5.0, aiming to provide a strategic, coordinated, and consistent approach to dissemination and communication measures to maximize the project's impact.

PROPRIETARY RIGHTS STATEMENT: THIS DOCUMENT CONTAINS INFORMATION, WHICH IS PROPRIETARY TO THE HiPower 5.0 CONSORTIUM. NEITHER THIS DOCUMENT NOR THEINFORMATION CONTAINED HEREIN SHALL BE USED, DUPLICATED OR COMMUNICATED BY ANY MEANS TO ANY THIRD PARTY, IN WHOLE OR IN PARTS, EXCEPT WITH THE PRIOR WRITTEN CONSENT OF THE HiPower 5.0 CONSORTIUM THIS RESTRICTION LEGEND SHALL NOT BE ALTERED OR OBLITERATEDON OR FROM THIS DOCUMENT. THIS PROJECT HAS RECEIVED FUNDING FROM THE CHIPS JOINT UNDERTAKING (JU) UNDER GRANT AGREEMENT NO.101194250. THE CHIPS JU RECEIVES SUPPORT FROM THE EUROPEAN UNION'S HORIZON 2020 RESEARCH AND INNOVATION PROGRAMME ANDAUSTRIA, BELGIUM, CZECH REBUPLIC, DENMARIKDENMARK, FRANCE, GERMANY, ITALY, NETHERLANDS, SLOVAKIA, AND SLOVENIA.

1 Introduction

The scope of this deliverable is to outline the strategy of the **HiPower 5.0** project to involve important stakeholders and describe the communication and dissemination strategy that will be implemented for this project. It must be considered as a guide for the Consortium, as well as a common exercise that will require the participation of each individual project partner.

Dissemination strategies include the definition of objectives, audience, and dissemination channels, alongside the provision of a list of planned or performed dissemination activities by the partners. To ensure high visibility within the power electronics and semiconductor domains, the **HiPower 5.0** consortium will engage in activities typical of ambitious Chips JU initiatives. These activities include, but are not limited to:

- **Scientific Publications:** Publishing high-impact results in open-access journals and presenting at key IEEE conferences (e.g., EPE ECCE, ISPSD).
- **Industrial Exhibitions:** Representation at major trade fairs such as **PCIM Europe** or **Electronica** to demonstrate use-cases to the industry.
- **Clustering Events:** Joint workshops with other Chips JU projects to identify synergies and standardize approaches across the European value chain.
- **Technical Workshops & Webinars:** Organizing dedicated sessions for students and engineers to transfer technical know-how regarding new power/reliability methodologies.

The central communication platform focused on the broader public is the **HiPower 5.0** project website. This site contains comprehensive information about project objectives and activities, the consortium, outcomes, and news. The project website is regularly updated and written in a way that is accessible to the general public while retaining technical accuracy. Additionally, external project dissemination is supported by social media channels, primarily utilizing the **LinkedIn** platform to reach professional stakeholders. The strong popularity of social media among the broad public makes it an effective tool for the dissemination of **HiPower 5.0** achievements.

The project website and social media are strictly used for external dissemination. All confidential data and internal communication within the project consortium are managed via the secure internal communication server (e.g., SharePoint as dedicated repository).

Activities in the area of dissemination and communication will be documented via an internal work platform and shared tables so that the fulfillment of objectives can be monitored and checked on a regular basis (at least every 6 months). Various planned activities will be implemented at different levels during the project. If necessary, corrective measures will be taken after consultation with the project consortium.

Based on the defined target groups and objectives described, the dissemination and communication strategy aims to maximize the distribution of project results where applicable and to spread relevant news through a wide and diverse scope of channels. In doing so, dialogue and information exchange with the scientific community, relevant industries (automotive, industrial drives, renewable energy), and the broader public will be stimulated.

The methodology followed for the elaboration of the current deliverable is based on the constructive and close collaboration of the dissemination leader (Juraj Marek, STUBA), communication leader (Francesco Iannuzzo, POLITO) with the project coordinator and all project partners. Stakeholder engagement and dissemination/communication activities will take place in **WP7** (Dissemination, Communication, and Exploitation) under **Objective 7.2**, including related subtasks. The output of these tasks is also intrinsically linked to the exploitation activities (**Objective 7.3**).

According to the **HiPower 5.0** Description of Action (DoA), **WP7** will dedicate its efforts to promoting and communicating the project, its objectives, findings, and accomplishments at the local, national, and European levels. To achieve this, **WP7** will use a series of online and offline tools and strategies throughout the project lifetime to bring attention to the project, gain trust, and ensure market acceptance of the results. The

achievement of **WP7's** main goals is highly dependent on the active role and participation of the partners in all tasks and activities of this work package. As described in the DoA, all partners are responsible for their individual dissemination and communication tasks.

Dissemination progress and activities will be reported in the following deliverables:

Deliverable (number)	Deliverable name	Work package number	Short name of lead participant	Type	Dissemination level	Delivery date
D7.1	Website	WP7 (T7.2.1)	STUBA	DEC	PU	M06
D7.3	Initial Dissemination and Communication Plan	WP7 (T7.2.1)	STUBA	R	PU	M12
D7.6	Newsletter M12	WP7 (T7.2.1)	STUBA	DEC	PU	M12
D7.8	Newsletter M24	WP7 (T7.2.1)	STUBA	DEC	PU	M24
D7.9	Final Dissemination and Communication Plan	WP7 (T7.2.1)	STUBA	R	PU	M33
D7.11	Newsletter M36	WP7 (T7.2.1)	STUBA	DEC	PU	M36

Table 1-1: List of Deliverables connected with dissemination and communication activities

2 Stakeholder Engagement Strategy for HiPower 5.0

Stakeholders are defined as individuals or groups capable of influencing the activities and outcomes of a project or organization. They represent both their own interests and the interests of the broader public, specific groups, or other organizations. Engaging stakeholders is crucial for project success [PMBOK,2000], as their input can profoundly impact project actions, both positively and negatively.

The **HiPower 5.0** project leverages a robust process of stakeholder engagement to integrate relevant actors for defined purposes, thereby ensuring strong alignment with the project's ambitious technical and societal objectives. Furthermore, engagement acts as a core accountability mechanism [AccountAbility,2015] obligating the consortium to transparently report, explain, and answer to stakeholders regarding key decisions, actions, and performance metrics.

To effectively manage the diverse stakeholders of **HiPower 5.0**, several targeted engagement approaches [StkHold, 2025] are applied:

- **Partnership:** A fully collaborative, two-way engagement characterized by shared accountability, joint responsibility, mutual learning, action planning, and collective decision-making.
- **Participation:** Stakeholders are integrated into the project team, actively contributing to task delivery or holding responsibility for specific activities. This is a two-way engagement with clearly defined roles and responsibilities.
- **Consultation:** A limited two-way relationship where the project actively solicits feedback from stakeholders, who have no direct operational responsibility and whose influence is generally confined to the scope of the consultation.
- **Push Communication:** A one-way channel where the project proactively transmits targeted information to stakeholders using various tools (e.g., newsletters, emails, reports). The primary goal is to inform.
- **Pull Communication:** A one-way channel where information is made accessible (e.g., website, public databases), allowing stakeholders to independently choose when and how to access the content.

The most intensive methods—**Partnership** and **Participation**—are reserved for **key players**: stakeholders characterized by high influence and high interest, whose involvement yields considerable benefits to **HiPower 5.0**. Failure to manage these critical actors appropriately would bring a significant risk to the project's overall impact.

The **HiPower 5.0** project involves a large European consortium consisting of 45 partners, forming a robust network of key players including Original Equipment Manufacturers (OEMs), large industries, Small and Medium-sized Enterprises (SMEs), universities, and research institutes. These core stakeholders are engaged in **HiPower 5.0** primarily through the **Participation** approach, actively contributing to both technical execution and dissemination objectives.

Consultation - The stakeholder engagement approach consultation is related to the setup of a work group for PHM topics, which line is going through the whole project, and is included in all WPs and UCs, and has the clear focus of bringing industrial and academic stakeholders from wafer, chip, package, board and system community together.

The push communication is used to inform the key players of the project, but also interested communities about the main objectives, important achievements and milestones of the project. Here, very important role plays scientific and engineering publications, presentations on conferences and workshops, but also at trades and fairs.

The pull communication is used to inform the interested public about the HiPower 5.0 project. The pull communication is mainly supported by the HiPower 5.0 webpage (see www.hipower50.eu) social media and press releases. In this context, several social media activities were performed by the HiPower 5.0 partners, and various HiPower 5.0 announcements were done by the HiPower 5.0 partners via press releases.

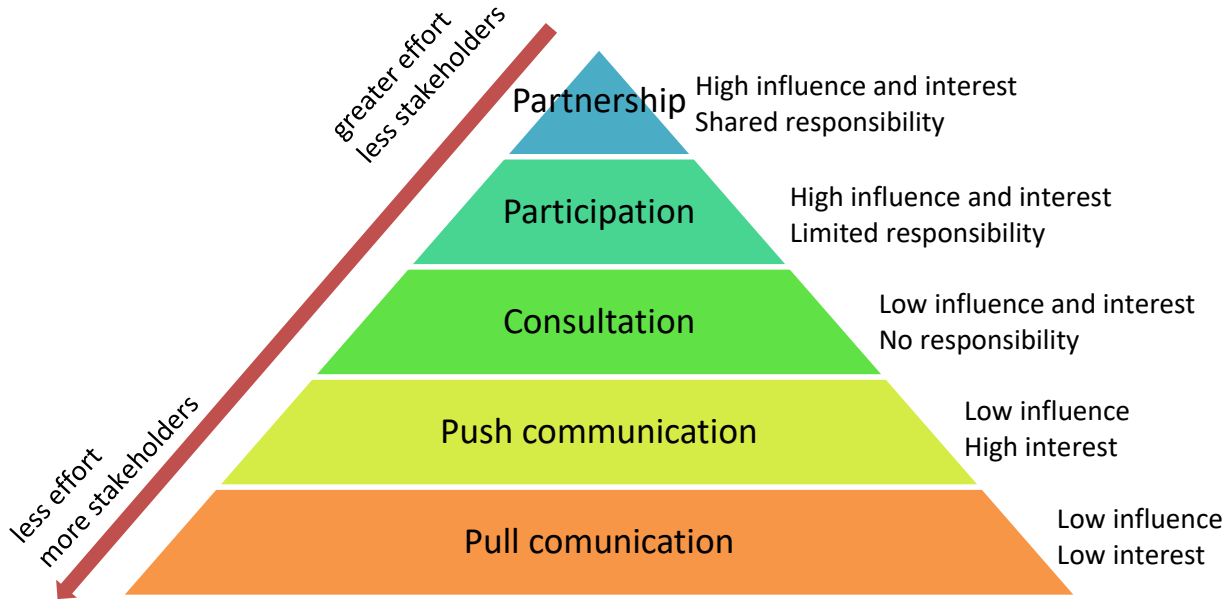

Figure 2-1: Stakeholder Communication Pyramid [StkHold,2025]

Initial stakeholder analysis was already done during preparation of the project. In the next table identified stakeholder's groups and their interest in the project are summarized.

Target Group	Interest in the Project	Influence
Industry Stakeholders	**High** Utilization of project's results in everyday' s operations Strengthened innovation by highly innovative eDrive components Participation in project events Inspiration for new ideas and applications	High
Scientific communities (Researchers and Academia engaged in research initiatives and / or working in research / academic institutes conducting core or application research …)	**High** Organization of workshops Participation in publications and events Inspiration for future research initiatives based on the project's results	Medium
Industry Associations & Technology clusters (European initiatives, various EU and national unions, major industry associations)	**Medium** Inclusion of project results to collaborative re-search activities Dissemination of project results to their members Participation in events for knowledge exchange	Medium

Participants, project partners and relevant stake-holders active in Chips JU and Horizon Europe related to HiPower 5.0	**High** Identification of common topics Synergies and collaborations for promotion of results Enhancing innovation	High
HiPower 5.0 application **policymakers**	**High** Evaluation of the project's Social-Technological-Economic-Environmental-Political (STEEP) aspects Definition of future research and innovation directions for the EC initiatives, considering the project's acquired knowledge and experience Input for standardization activities	High
General public and civil society (Citizens / users of HiPower 5.0 solutions who benefit from the project out-comes)	**Low/Medium** Acquiring new experiences and utilize the project results in scenarios that are addressed to the public for gathering feedback	Low

2.1 Power/Interest Matrix Analysis

Next graph explains in simple way the principle of power/interest matrix. It links the interest of various stakeholders in the project results with the effort required to inform them and maintain their attention to achieve the best possible communication of the project results.

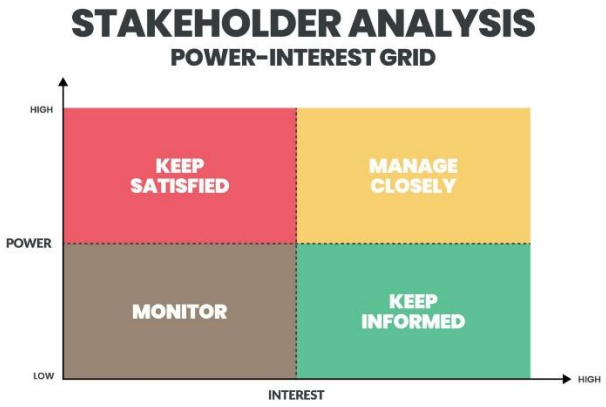

Figure 2-2: Standard Power/Interest Matrix

Applying the Power/Interest Matrix, the appropriate strategy for each category is defined:

A. Manage Closely (High Power, High Interest)

These groups are critical for the project's direction and successful execution. **Strategy: Full Engagement (Partnership/Participation).**

- **Consortium Members:** They perform the work, hold the IP, and are legally bound by the Grant Agreement. Their commitment and technical input directly determine success.
    - *Engagement:* Regular WPs meetings, decision-making via the General Assembly, active task participation, and shared responsibility for technical deliverables.

- **Funding & Policy Bodies (Chips JU, EC, National Authorities):** They provide the funding and set the strategic context (Green Deal, Chips Act). They must be satisfied that the project adheres to its technical and financial objectives.
    - *Engagement:* Formal reporting (deliverables, reviews), political advocacy, strategic alignment on European value chain goals, and financial audits.

B. Keep Satisfied (High Power, Low Interest)

These groups can influence the project significantly, but their direct, day-to-day interest is limited to specific areas (e.g., compliance, market impact). **Strategy: Maintain Support (Consultation/Push Communication).**

- **End-User OEMs (External to Consortium):** They will ultimately adopt the technology or be influenced by its performance gains. They have the power to validate the market need.
    - *Engagement:* Appointing them to an **External Industrial Advisory Board (IAB)**, targeted consultation on use-case requirements, and high-level demonstrations of prototypes.
- **Regulatory & Standardization Bodies:** They hold the power to dictate market access (e.g., safety certification, environmental compliance).
    - *Engagement:* Consultation on proposed component standards, reporting on safety and reliability methodologies, and participation in relevant technical committees.

C. Keep Informed (Low Power, High Interest)

These groups are keen on the project's outcomes but do not have the direct authority to block or change the project's course. They are valuable multipliers for dissemination and future exploitation. **Strategy: Active Dissemination (Pull/Push Communication).**

- **Scientific Community:** Interested in breakthroughs in GaN/SiC reliability, integration, and modelling.
    - *Engagement:* Publishing open-access papers, presenting at key conferences (e.g., PCIM Europe, EPE ECCE), and running technical workshops/webinars.
- **Wider Supply Chain (Tier 2/3):** Interested in adopting new materials, tools, and processes developed by the consortium.
    - *Engagement:* Public technical reports, project website news, and specific training or demonstration events focused on industrial adoption.

D. Monitor (Minimal Effort) (Low Power, Low Interest)

These groups require minimal effort but should be easily able to access basic information should their interest increase. **Strategy: Passive Communication (Pull Communication).**

- **General Public:** Interested in the societal benefits (greener transport, climate neutrality).
    - *Engagement:* Regular website updates, high-level press releases translated for non-experts, and social media presence.
- **General Media/Non-Specialist Press:** Interested in major milestones or political announcements.
    - *Engagement:* Providing a press kit and responding to specific inquiries.

This analysis ensures that **HiPower 5.0** allocates its limited resources strategically, focusing the most intensive engagement (Partnership/Participation) on the stakeholders essential for the technical and market success of WBG power electronics in Europe.

2.2 Key messages

The message component of the dissemination and communication strategy comprises the set of arguments, reasons and facts to be used to convince the targeted audiences of the value in using HiPower 5.0 results. Key messages are intended to deliver relevant and meaningful content suited to communicate the HiPower 5.0 value proposition to each of the target audiences.

The HiPower 5.0 project has a primary key message and several supporting key messages.

- **High level message:**
  "HiPower 5.0 is building the foundation for Europe's climate-neutral transport future by achieving unprecedented levels of efficiency and reliability in e-Drive systems through the next generation of WBG semiconductor technology, fully aligned with the Chips Act and the Green Deal."

Supporting key messages:

- **Enabling the Green Transition:**
  "HiPower 5.0 is directly enabling the EU's Green Deal by developing highly efficient, ultra-compact Wide Bandgap (WBG) power electronics. These innovations significantly cut energy losses, driving the transition to **cleaner, higher-performance electric mobility** in the automotive and maritime sectors."

- **Building European Technological Sovereignty:**
  "As a major Chips JU initiative, HiPower 5.0 reinforces European technological independence. The project unites key players across the value chain—from wafer to final application—to establish a resilient, cutting-edge **all-European supply chain** for next-generation GaN and SiC power devices."

- **Delivering Reliability and Sustainability:**
  "Beyond high efficiency, HiPower 5.0 is pioneering new reliability and lifetime modelling for power electronics. This focus ensures the resulting systems are not only high-performing but also **highly durable and trustworthy**, offering sustainable solutions with reduced maintenance needs for industry and end-users."

3 Tools & channels for Communication

Important note: Within HiPower 5.0 we split dissemination activities to Communication activities, oriented on more general public, and Dissemination activities, oriented more on scientific communities.

3.1.1 Project website

The HiPower 5.0 website (https://www.hipower50.eu/) is the main communication channel. The information is split into two categories, namely static and dynamic. The static part describes the consortium as such, the partners, the project vision and goals, and the funding agency, whereas the dynamic part presents the achieved results along the project execution through news, event announcements, and newsletters.

Figure 3-1: Homepage of the HiPower 5.0 website

A dedicated section has been activated from the beginning about the progress done. All the partners will contribute to build up the information shared here by adding news, events, and achievements of public interest.

The Communication Leader is responsible for stimulating the partners in the communication activity as well as the task of periodically share project progress.

3.1.1.1 Partners' websites

Additionally, all partners in the project are encouraged to use their own websites to link and promote the HiPower 5.0 project. Ideally, links to the HiPower 5.0 project website will be made from most of the partner websites, and partners' marketing departments are encouraged to make good use of it.
It is noted that some larger corporations are unable to make this sort of publicity.

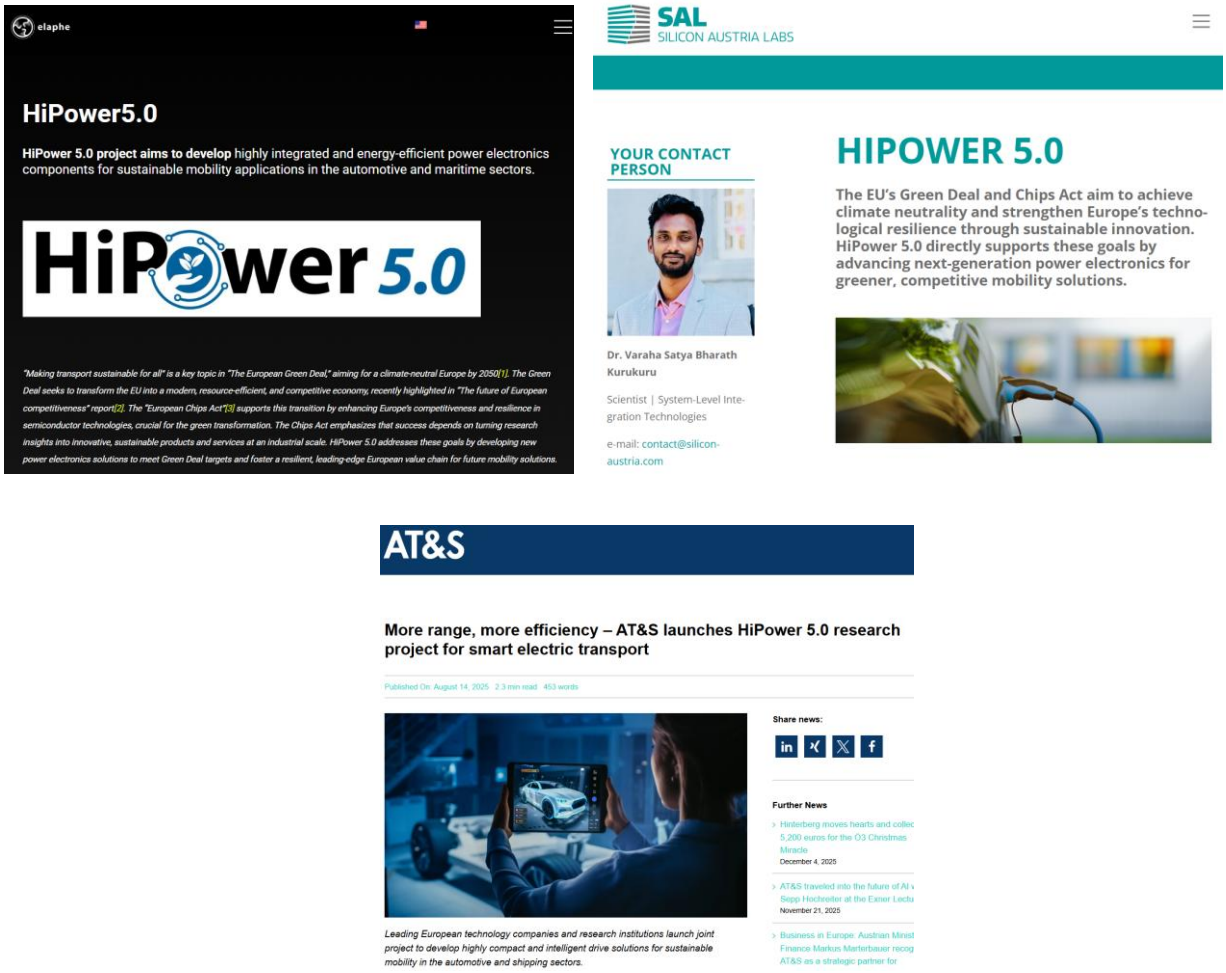

Figure 3-2: Partner and national agencies websites informing about HiPower 5.0 project

3.1.1.2 Web visibility

Having a good web visibility is today an important factor. Even the best product, service, project can potentially be useless to bringing in customers if no one knows about it. Thanks to the main and project partners' websites, the HiPower 5.0 project gained good visibility in the main search engines from very first moment of the project (Figure 3-3).

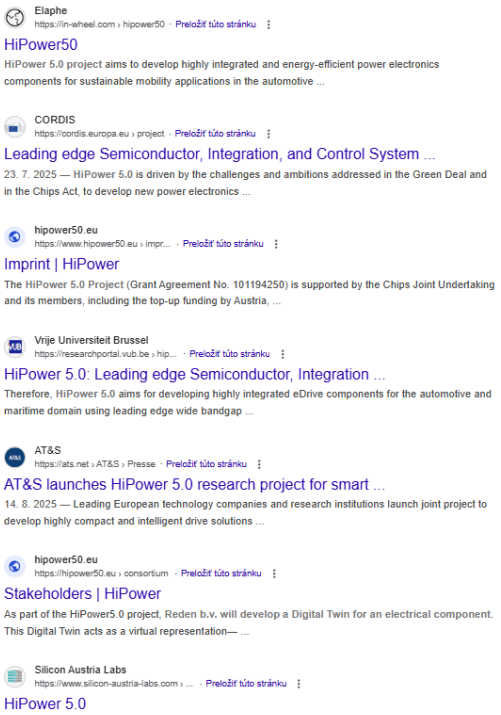

Figure 3-3: Results from web search engine for key word HiPower 5.0

3.1.2 Social media

In addition to the official project website, HiPower 5.0 will use social media channels to disseminate project results. The project's presence on the central technical social networking platform, LinkedIn, was established from the project's early stages.

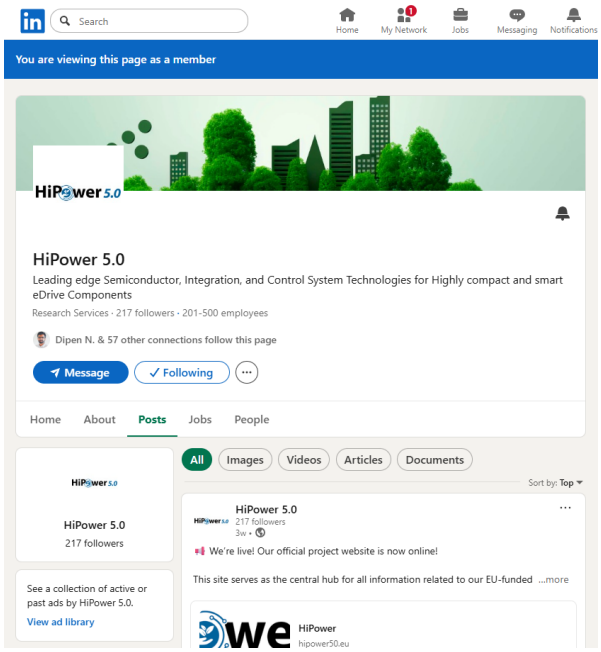

Figure 3-4: HiPower 5.0 LinkedIn page

The purpose of social media tools will be to promote the project and its results in a timely, proactive manner, enabling a two-way exchange. HiPower 5.0's presence in social networks aims to accomplish the following specific objectives:

- Generate awareness and multiply the communication efforts done by all consortium partners.
- Raise interest on the project topic in expert and non-expert audiences.
- Promote understanding of knowledge, activities, benefits, and outcomes generated through the project lifecycle.
- Promote feedback gathering, consultation, and engagement with target groups.
- Increase content visibility and interaction.

Social media will raise awareness of the project, its results, benefits, and use and applicability, and seek support from policymakers and public bodies. Finally, social media will increase public interest in the project topic and its impact on everyday life.

Via social media, updates on new publications, newsletters, and events that might be of interest for the broad public audience, but also for other communities (scientific, industrial) and the private sector, will be reported with links to a repository (i.e., project website). It may also help to collect feedback on project outcomes.

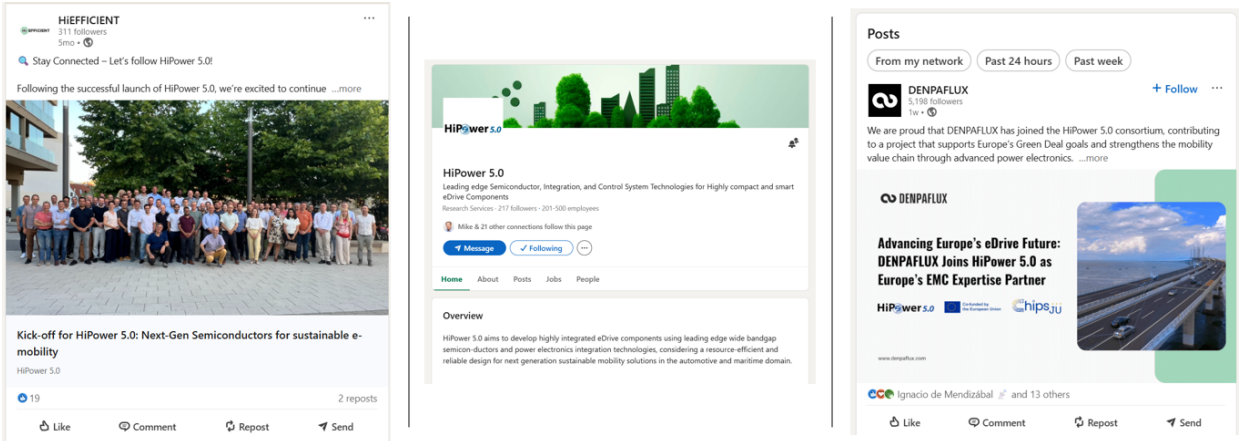

Figure 3-5: Results from the web search engine for the keyword HiPower 5.0

4 Tools & channels for Dissemination

The following dissemination objectives (DO) are defined:

- DO1: Maximize the HiPower 5.0 outreach in the target audience via appropriate key messages.
- DO2: Spread the scientific and technological knowledge generated in the project within and beyond the consortium.
- DO3: Establish connections with other projects and initiatives for knowledge and innovation transfer.
- DO4: Attract potential users and foster the acceptance of the project's outcomes by new and current users and support the project's exploitation strategy.
- DO5: Encourage the development of further outcomes in new initiatives.

The project's dissemination activities will be collectively performed by all partners according to their profile and expertise. Industrial partners will approach their relevant industry sectors while the academic and research partners will focus on disseminating the project results towards research institutions and universities across Europe.

The execution of the dissemination plan will cover all dissemination channels and audiences identified to reach the defined dissemination activities D1 to D6. The figure below provides an overview on the planned dissemination activities.

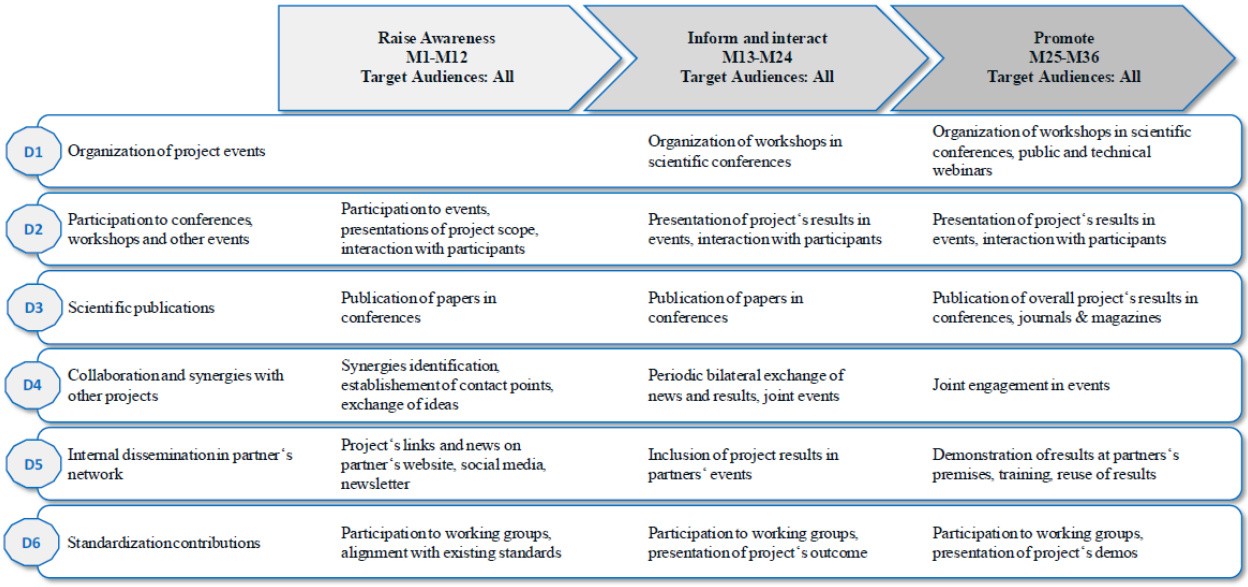

Figure 4-1: Dissemination activities

4.1.1 Publications

The HiPower 5.0 consortium has planned to disseminate the project results through various means, including scientific presentations at conferences and workshops, publication of papers in journals, magazines, and conferences. Additionally, the partners will try to participate in activities such as tutorials, panels, round tables, and seminars during international events to represent the excellence of the project.

The project partners usually submit their publications to the following relevant magazines and scientific journals:

- SAE, MTZ or ATZ
- IFAC or IEEE affiliated journals (e.g., IEEE Trans. on Electron Devices, IEEE Trans. On Control Systems Technology, IEEE Trans. on Industrial Electronics, IEEE Trans. On Power Electronics, IEEE Journal of Emerging and Selected Topics in Power Electronics, Packaging and Manufacturing Technology, IEEE Electron Device Letters, Access)
- IET Power Electronics
- Electronics and Energies (MDPI)
- Electronic letters
- Energies
- Microelectronics Reliability
- Thin Solid Film
- Articles in international conferences
- Organization of special issues in peer reviewed journals and special sessions or tutorials in conferences
- Notes in special interest newsletters or magazines
- Articles and features in local mass media

There is a wide variety of conferences and workshops targeted at specialized compound semiconductor technologies, structures, devices and systems. These conferences are usually visited by the partners and are in particular

- Yearly EU and CHIPS JU events, e.g., EFECS
- TRA (Transport Research Arena Conference)
- International Exhibition and Conference for Power Electronics, Intelligent Motion, Renewable Energy and Energy Management (PCIM Europe)
- International Conference on Thermal, Mechanical and Multi-Physics Simulation and Experiments in Electronics and Microsystems (Euro-SimE)
- GaN Marathon conference
- ASME International Technical Conference and Exhibition on Packaging and Integration of Electronics (InterPACK)
- IEEE Electronic Components and Technology Conference (ECTC)
- IEEE Electronic System-Integration Technology Conference (ESTC)
- European Symposium on Reliability of Electron Devices, Failure Physics, and Analysis (ESREF)
- European Solid-State Device Research Conference (ESSDERC)
- IEEE Applied Power Electronics Conference and Exposition (APEC)
- IEEE Energy Conversion Congress and Exposition (ECCE)
- EPE: European Conference on Power Electronics and Applications
- CLEPA Technology Day
- CIPS Conference
- EUCAR Conference
- SAE (Annual world congress on Automotive Developments)
- EVS (Electric Vehicle Symposium)

- EEVC (European Electric Vehicle Congress)
- EGVIA/2ZERO workshops & RTR Conference (Road Transport Research - by 2ZERO, CCAM and EU organized)
- IEEE International Electron Device Meeting (IEDM)
- IEEE International Reliability Physics Symposium (IRPS)
- International Symposium on Power Semiconductor Devices (ISPSD)
- CS MANTECH, WOCSDICE, WOCSEMMAD, IIRW
- IEEE IECON IEEE Industrial Electronics Society
- EPoSS Annual Forum (European Technology Platform on Smart Systems Integration)

Also, more diverse meetings and symposia like the following will be addressed if applicable

- GaN Marathon
- SafeComp
- ECCOMAS Thematic
- EPE/ECCE (power electronics)
- FuSaCom
- SEMICON

Events and summer schools will be co-organized and supported by project partners. These events will be focused especially on PhD students engaged in the project.
Besides the participation in international scientific events, university partners will enable several PhD students and postdocs to work during the HiPower 5.0 project. Moreover, several academic partners are also actively engaged in teaching that is another avenue to keep young people motivated and aware of the developments in this field. Knowledge generated within the project also leads to know-how, which adds reputation and standing to partners.

Industrial dissemination will be the second important pillar regarding publications. It is of high relevance to address SMEs and large industry directly and to ensure technical take up by competitive players with solving corresponding know-how protection. The dissemination activities will combine complementary actions in research, business partner support within the technical community and end users. Semiconductor companies will handle this project as an integrated part of their R&D strategies, communicating results with brochures, customer addressing and public talks. Participation to European meetings, workshops and conferences, and other important international trades and symposia is planned to increase the dissemination impact. Moreover, great emphasis will be given to the links which are already active between the project partners. The industrial partners will support the consortium and especially the related academic partners in publication tasks by provision of new material and upcoming results as far as possible.

4.1.2 Events

Throughout the duration of the project, the project partners will actively participate in events such as technical conferences, industrial congresses, exhibitions, general public events and workshops. Events will ensure the involvement of target groups of stakeholders. Project partners' participation in external events aims to raise key stakeholders' awareness and facilitate knowledge sharing, thus increasing the project impact.

To share and discuss knowledge and results acquired in the course of the HiPower 5.0 project, workshops will be organized. At least four conferences and summer schools will be organized by partners: GaN Marathon, Summer school, ASDAM conference, ADEPT conference.

General public events such as the science week, or night of science will be addressed to the general public and non-specialists. They will ensure that general public knows what power electronics, modern GaN devices and development in this area is about and its impact on everyday life (e.g. creation of jobs, development of new technologies, better quality products, more convenience, improved lifestyle, more green vehicles, etc.).

4.1.3 Contributors

All partners will contribute to the tasks as detailed above and specifically by participating in international conferences and publishing in established international journals. Based on their contributions newsfeed on the public website will be updated.

To better organize and control dissemination activities, a table with all planned and performed activities has been created and is available to all partners in the project SharePoint, and all partners are regularly asked to update this table with planned activities for next months.

A version of this table from December 2025 is shown in chapter Annex I.

5 Terms, Abbreviations and Definitions

HiPower 5.0	Leading edge semiconductor, integration, and control system technologies for highly compact and smart edrive components towards more sustainable power electronics 5.0
DEC	Websites, patents filing, press & media actions, videos, etc.
DEM	Demonstrator, pilot, prototype, plan designs
DMP	Data Management Plan
DO	Dissemination Objective
GaN	Gallium Nitride
HW	Hardware
R	Document, report (excluding the periodic and final reports)
SEN	Sensitive, limited under the conditions of the Grant Agreement
SiC	Silicon Carbide
PU	Public, fully open, e.g. web (Deliverables flagged as public will be automatically published in CORDIS project's page)
WP	Work Package
